and integrated

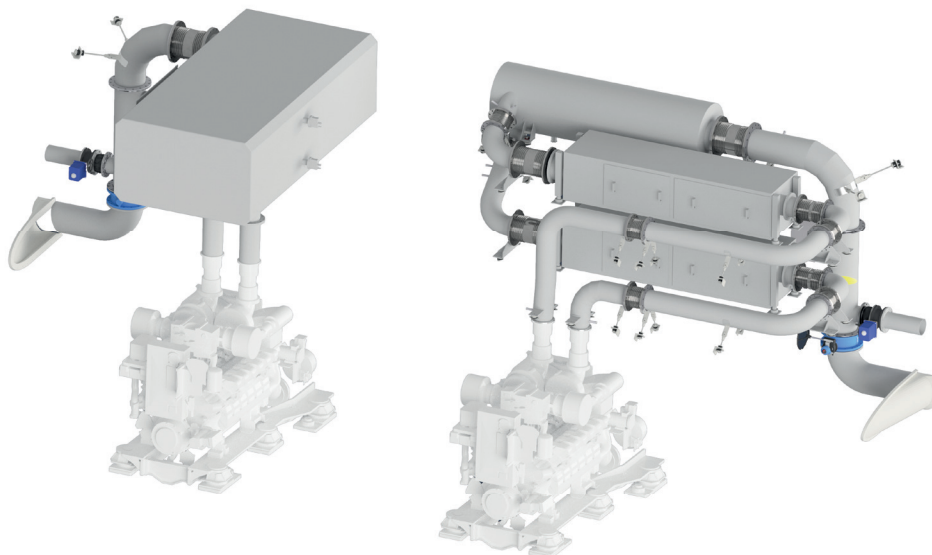

Anti vibration control

Anti vibration control

Vibrations are often an issue on yachts. MarQuip is a leading specialist in avoiding the unpleasant and disruptive vibrations which are caused by gases running through exhaust systems.

Exhaust gases generate vibrations and flow noise, as well as expanding steel and stainless steel exhaust pipes. MarQuip offers a solution that combines vibration reduction as well as adapting expansions caused by the thermal expanding of materials.

Our anti-vibration control systems use high-quality suspension mounts – fixed or sliding, hanging or pivoting. These parts are carefully selected and designed to meet our clients' most stringent requirements. MarQuip guarantees the anti-vibration control of all our systems and we will cooperate with your anti-vibration specialist to design an effective, comprehensive solution.

The way systems are fitted makes a world of difference, with only a small margin of error between a silent system and annoying vibrations. Leave it to the specialists at MarQuip and you can rest assured that all will go well.
